

Masalles

Dear Breeder,

Thank you for trusting Masalles and acquiring our vitamin complex “**Top Complex Peregrinus**”.

Top Complex Peregrinus has been created and designed especially for peregrine falcons. It provides specifically and according to your metabolic needs nutrients, vitamins, amino acids and minerals for maintenance, molting, reproduction and flight. With palatability fully accepted by hawks and with the necessary amount of pigments for a perfect jalde.

All its components of easy assimilation contribute to the special care of the liver and kidneys, especially sensitive in peregrine falcons, through two systems: the composition with premium ingredients prevents metabolic steps in these organs and at the same time the incorporation of natural and regenerative antioxidant compounds complement your care

BASIS

The feeding of the birds of prey in captivity is usually based on chicks or quails that follow a little varied feeding in the productive system from which they come and form homogeneous lots with respect to the nutritional contributions. Due to multiple factors dependent on the requirements of the hawk at that time and the contributions of the food itself, punctual deficiencies or imbalances occur, often affecting important nutrients such as essential amino acids, minerals, essential fatty acids and sugars. If the food does not complement those specific deficiencies, they become important deficiencies that affect organs or systems, as important as the immune system.

When defrosted food is supplied there is loss of protein and vitamins by freezing and / or defrosting, fats become rancid in a very short time and in these cases it is more necessary if the feeding of raptors of captivity can be complemented.

ADVANTAGES:

- * Contribution of free amino acids, assimilable minerals, vitamins, essential fatty acids and sugars.
- * Stimulates the digestive process in its different phases, improving protein and energy metabolism.
- * Increases the capacity of your immune system and therefore its physical and reproductive capacity.

HOW TO USE:

Mix with the food at a rate of 0.5 to 1gr per kg of bird weight. Its daily supply is advised to compensate for all the possible deficiencies related to the feeding that are given to the peregrine falcons in captivity.

RECOMMENDATIONS:

The most immediate effects can be seen in groups of healthy birds with a pathogen-free diet, either properly defrosted or fresh. The intestinal health and flora are key factors in the absorption of nutrients and very sensitive in peregrine falcon that we recommend evaluating by a specialist and in which the administration of probiotics helps

VETERINARY ASSISTANCE:

It is clear that there are other points that could be treated or expanded from a personalized point of view depending on the needs of each bird, for this you have at your disposal our falcon veterinarian **Jorge García de la Fuente** (col.33 / 2036) at which you can check in at avianvet@outlook.com or by calling at this telephone number +0034 935 442 313.
